Ok, that looks very strange. I now checked and someone else added that check.

Do like this,:

Outcomment the lines with cnVerifier.isValid ... check in DataManagerController.java

Also update DatamanagerACLFiter.java to have checkRequest() always return true.

That should disable security checks and you can start using it.

Hi,

Yes sorry that was my bad.

I get the same problem as previously and the exact url is:

MailScanner warning: numerical links are often malicious: 127.0.0.1:8461/datamanager/proxy/cmbbox1.testcloud1.aitia.arrowhead.eu/sensor1

which results in the response/error: "Request returned with INVALID_PARAMETER: System name has invalid format. System names only contain letters (english alphabet), numbers and dash (-), and have to start with a letter (also cannot end with dash)"

Kind regards

Anton Johansson
